ELEMENTS OF SECTIONS

Look for this blue line in the left margin of the Design Manual documents. This line shows you where the latest update has been made.

SYMBOLS FOR ELEMENTS OF SECTIONS

A	Cross-sectional area (mm ²)
A_w	Cross-sectional area of web or webs (mm ²)
D	Outside diameter of round tube (mm) Diameter of round rod (mm) Diameter of round hole in square tube (mm)
I	Moment of Inertia (mm ⁴)
J	Torsional constant (mm ⁴)
R	Radius (mm)
R_f	Flange toe radius (mm)
R_i	Radius of inside corner (mm)
R_o	Radius of outside corner (mm)
S	Section modulus (mm ³)
S_b	Section modulus from the bottom of an unsymmetrical section (mm ³)
S_t	Section modulus from the top of an unsymmetrical section (mm ³)
Wt	Weight of section (kg)
b	Width of section (mm) Outside dimension of square tube or bar (mm)
b_f	Width of flange (mm)
b₁	Width between flange section in strut (mm) Top width of hat section (mm)
d	Full depth of section (mm)
d₁	Outer depth of shape in F section (mm)
r	Radius of gyration (mm)
s	Spacing between back to back channels or angles (mm)
t	Thickness of section (mm) Wall thickness of tubes (mm)
t_b	Thickness of width dimension (mm)
t_d	Thickness of depth dimension (mm)
t_f	Thickness of flange (mm)
t_w	Thickness of web (mm)
x	Distance from the outside of the web to the minor (Y-Y) axis of a channel section or other similar unsymmetrical sections (mm)
y	Distance from neutral X-X axis to the outer-most fibers of a cross section (in) Distance from the back of the flange to the major (X-X) axis of a tee section or other similar unsymmetrical sections (mm)

ELEMENTS OF SECTIONS

INTRODUCTION

The values shown in the following tables have been computed from the nominal dimensions of the shapes.

The tables are arranged in ascending order of sizes with values tabulated for quick reference when selecting members for design requirements. Note that section properties are given for both “strong” (X-X), and “weak” (Y-Y) axis for the nonsymmetrical shapes.

Some shapes may not be stocked at all times as regular inventory items so the designer should consult the **Availability List** before selecting a specific size for an application.

LARGE EXTREN® STRUCTURAL SHAPES

457mm AND 610mm EXTREN® FIBERGLASS I-SHAPES

457mm and 610mm **EXTREN®** I-Shapes are the largest standard structural shapes pultruded. Their design properties will allow the engineer to design larger all-composite structures, spanning greater distances than were ever possible with standard pultruded fiberglass structural shapes.

As shown in the **ELEMENTS OF SECTION** tables, an **EXTREN®** 610mm I-beam has a moment of inertia of $792 \text{ mm}^4 \times 10^6$, more than four times as stiff as the **EXTREN®** 305mm x 305mm x 12.7mm W-shape. This means that for longer spans when shear deflections are negligible, I-610 will carry the same load as a W-305 at any given span and produce about 1/4 the deflection. Or stated another way, when shear deflection is negligible, an I-610 can carry four times the load of a W-305 and produce about the same deflection.

EXTREN® 457mm and 610mm I-shapes, with their unique thick flange construction, assure the engineer that stress will not normally control the design when the compression flange is adequately laterally supported. Other sections in this chapter offer suggestions for effective lateral bracing systems.

The designer is also cautioned that it may be necessary to add stiffeners between the flanges at points of concentrated loads and at supports. This is referenced in Section 8 — **FLEXURAL MEMBERS (BEAMS)** of the Strongwell *Design Manual*.

DOUBLE WEB BEAMS

203mm AND 914mm EXTREN DWB®

Strongwell produces two sizes of double web I-beams, an 203mm x 152mm DWB and a 914mm x 457mm DWB. They are each offered in “all glass” or “hybrid” forms (hybrid refers to the combination of the dual carbon and glass reinforcements).

The carbon/glass hybrid beam has a flexural modulus of elasticity that is approximately $41.4 \times 10^3 \text{ N/mm}^2$, compared to that of a standard **EXTREN®** wide flange which ranges between 17.9 to $19.3 \times 10^3 \text{ N/mm}^2$.

Additionally, the double web shape has significantly improved the torsional stability of the beam under load. This increased stability is very significant and reduces the beams need for lateral bracing.

Section 17 — **EXTREN DWB® DESIGN GUIDE** is devoted to design information from the 203mm x 152mm shape and the 914mm x 457mm shape.
